
Bd Accuri C6 Software Download _BEST_

[Download](#)

Surface expression of CD38 was determined on cell surface of PBMCs after 24 hours of incubation with the anti-CD38 antibodies at different concentrations of IgG. Cells were stained with the appropriate secondary antibody followed by 10,000 events acquisition on the flow cytometer BD-Accuri. Positive and negative controls were included in each experiment. CD38 expression was determined by fluorescence intensity on the BD-Accuri. Graphs of the flow cytometry data from 6 individual experiments are shown as: a Representative controls for CD38 fluorescence intensity; b Mean fluorescence intensity c Concentration-response of CD38 fluorescence intensity in response to IgG d Ratio of CD38/antibody concentration tested e Effect of anti-CD38 antibodies on GFP-protein-expressing

cells, after 6 hours of incubation (left side) or 24 hours (right side) of incubation in the presence or absence of IgG. f Mean fluorescence intensity of GFP g Fluorescence intensity of CD38 labelled with anti-CD38 antibodies h Pearson correlation of the intensity of CD38 antigen on PBMCs and the intensity of CD38 on GFP-expressing cells. The graphs show representative data from one individual sample from 3 experiments. Intensities were determined in flow cytometry on BD-Accuri. Graphs show mean \pm S.D. Pearson's correlation was assessed by Spearman Correlation Coefficient. P
