To do this, I need to use the System.Diagnostics.EventLogReader. But I can't seem to find a way to do this without creating a Global.asax and doing it all in there. Is there a way to set a property or something? I know I can do this in the web.config, but I'm not familiar with that and I don't know if that's the best way. I can't find any System.Diagnostics properties in the Global.asax either. I just don't want to have to rebuild the entire website to do this. I'm using the .NET framework 4.0. Thanks. A: Thanks for all the help. I figured it out. using System.Diagnostics
